*Ref.: Recommendation Letter for Jean-Charles Belouard*

Dear Sirs,

It is my pleasure to recommend JEAN-CHARLES BELOUARD, around his very innovative ideas oriented to a community-based, non-hierarchical dialogue, driven by a deep understanding of the work of Alexander Grothendieck, easily the most important mathematician of the last century. I have known BELOUARD for the last six months, after fruitful mail exchanges around his projects, and I sense that his potential for renovating our understanding of the Science of Society is really huge.

Following Grothendieck, BELOUARD contends that the Universe is sheaf-theoretic, that is, a space where many perspectives unite (mathematics, philosophy, physics, biology, social sciences, etc.), and where natural dialogues between the disciplines propend towards political equality. His latest ideas combine a methodological survey of a structure of points of view (icosahedron), where many gnoseological layers enrich our perception of the World, with all sorts of fascinating ramifications onto politics and a sound construction of community.

I consider BELOUARD should receive the best possible support to develop his projects. If completed and propagated, they may have profound consequences in the balanced behavior of the society in the following decades.

Best,

F. Zalamea
